BUSINESS PLAN · LAUNCH EDITION

Charm City Sites

The factory is built. This plan picks up where the last one left off: what the machine now does on its own, the forty-five minutes that switch it on, and the forty-five days that turn it into $2,350.

Prepared for the operator and family

11. Where This Came From 8

1. What Changed Since the First Plan

The first business plan was written when this whole thing was an idea on paper. It promised a machine that would build websites by itself, find its own customers, and cost nothing to run. It answered questions like what to build, who would do which part, and whether the math could possibly work. That was its job, and it did that job. This plan has a different job, because the situation has changed underneath it.

The machine now exists. The whole factory arrived as a folder of sixty-one files: the website design, the scripts that turn a spreadsheet row into a finished site, five sets of automation instructions, installers for both a Mac and a Windows laptop, the setup walkthrough, and a finished example site that was built by the real tools, not by hand. Every item the first plan listed under "the assistant builds it" has been built, checked, and delivered. Nothing on that side of the ledger is still open.

Two things changed that reshaped this plan. First, the original assumed the operator would wait for a new MacBook before anything started; instead, the factory was made to run on the Windows laptop that is here today, so the clock can start immediately. Second, the risk profile flipped. "Can it be built for free" is now an answered question. The only question left is the ordinary one every business faces: will people buy. Everything in the pages that follow is aimed at that question.

2. The Business in One Look

For anyone reading this fresh at the kitchen table, here is the whole idea in one breath. Charm City Sites builds finished websites for Baltimore's home-service trades before any money changes hands, shows the finished thing to the owner, and sells it the same day for a flat one-time price. Alongside it sits a second small product: a missed-call helper that texts back within seconds when the owner cannot answer the phone, so a ringing job never quietly dies. The first trade is plumbers, because the city's aging rowhomes guarantee a steady drip of burst pipes and flooded basements.

The buyer is a plumber who is excellent at pipes and short on spare hours, whose customers check a screen before dialing, and who would rather look at a finished thing than imagine a proposal. The pitch is honest and short: "I built you a website, no strings. It is yours for five hundred dollars if you want it, live today." A neighbor handing over something real, with the plumber's own name already on it, gets replies that no remote stranger pitching "online presence" ever gets.

Product	What the client receives	Price
Spec website, built before payment	Mobile-first site: tap-to-call button, services list, quote form with instant alerts, reviews section, search-ready details	$500 first client, $650 second, $800 third

Product	What the client receives	Price
Missed-call helper	Automatic text-back within seconds on unanswered calls	$400 setup

Table 1: The two products and their prices

There are still no monthly fees, no subscriptions, and no fine print. The sites live on free internet space, the text service runs on the client's own phone account, and every tool inside the factory costs exactly zero dollars. That was true when the first plan was written, and the entire build since then kept it true.

3. The Money Math

$2,350

The whole target, unchanged - collected by Day 45 after ignition

The math did not move, because it never needed to. Three websites at $500, $650, and $800 add up to $1,950. One missed-call helper at $400 brings the total to $2,350. "Collected" still means money actually in the account, not promises: each site is paid for at delivery, and the helper is paid at setup. No invoice chases and no net-30.

What	Amount	When
Website, first client	$500	Week 2 or 3 after ignition
Website, second client	$650	Week 4
Missed-call helper, sold to a happy client	$400	Two days after any sale, automatically offered
Website, third client	$800	Weeks 5 and 6
Total collected	$2,350	Day 45 or sooner

Table 2: The collection ladder, anchored to ignition day

The price still climbs on purpose. The first site sells at a friend price because there is no track record yet. By the third, there are two live examples and a testimonial, and $800 reads as a bargain next to a $2,000 agency quote. What did change since the first plan is the cost side: it stayed at zero through the entire build. Every tool was verified free before it was used, and the factory was assembled without spending a dime, so there is nothing to earn back before the profit counts as profit.

The condition attached to the math is the same one as before, and it is the real job: the daily outreach has to actually happen. Roughly ten short messages a day, about a hundred by the second week, is what turns

three yeses from luck into arithmetic. The difference now is that the machine drafts and sends those messages on its own, which removes the last excuse for a quiet day.

4. The Factory, As Built

Here is what physically exists today: a single folder that turns a laptop into the factory. Unzip it, double-click one installer, and the machine assembles itself - the tools come in, the five workflows load, and everything wakes up with the computer from then on. No code gets written by hand at any point, on either a Mac or the Windows laptop.

The product side is a finished website design that accepts new businesses the way a cookie cutter accepts new dough. Every site gets a big tap-to-call button, a plain services list, a quote form that alerts the owner's phone within a minute, a reviews section, the details search engines read, and one of four rotating color schemes so no two plumbers look identical. The writing is done by a free artificial-intelligence service: the builder reads each spreadsheet row, asks for every word the site needs, and falls back first to a second free service and then to a safe pre-written default, so the line never stalls. Anything the machine is unsure about gets flagged for a human read instead of guessed at.

Around the product sit the five automation workflows that run the business itself. One watches the spreadsheet and turns every new row into a built, live website. One hunts for new plumbers across the map listings and the public licensing rolls, then enriches each lead with a phone number and email address. One writes and sends the daily outreach, with gentle follow-ups on day three and day seven, and stops politely when someone says no. One invoices closed deals on its own and offers the $400 missed-call helper two days after any sale. The last one watches the contact forms and the reply inbox, and pushes hot leads to the operator's phone within a minute. A finished example site, built end-to-end by the real tools and inspected on both a desktop and a phone screen, is sitting in the folder ready to show a prospect today.

When	What happens on its own
Every 2 minutes	Any new lead row becomes a built and deployed website
07:40 daily	The lead hunter finds new Baltimore plumbers and queues them up
09:00 daily	Morning report on the phone: who to email, who replied, what broke
09:11 daily	Up to ten personalized outreach emails go out
Every minute	Form fills and email replies hit the phone instantly
Every 30 minutes	Closed deals get invoices, then the $400 upsell offer two days later

Table 3: The machine's day, once the 45-minute ignition is done

The build was not declared finished on faith. The workflow wiring was validated node by node, eighty-four checks with zero errors. The example site was produced by the actual generator, not a mock-up, and passed a visual inspection on large and small screens. When the whole kit was later re-packed for the Windows laptop, every file was re-checked again, thirty-three more checks, all clean. The machine that this plan asks the operator to trust is the same one that already proved itself in testing.

5. What Is Left: The 45-Minute Ignition

The factory is built but not yet switched on. Switching it on is the only real work left, and it is not technical work; it is account-connecting work, done once and never again. The total is about forty-five minutes of clicking, spread across four free accounts, following a page-by-page walkthrough that was written for exactly this moment.

The steps are short. Five minutes to create the spreadsheet from two template files. Seven minutes to open a fresh outreach Gmail and generate its app password. Twenty minutes - the biggest chunk - to connect the control panel to Google, Telegram, and the mailbox. Five minutes for a free Cloudflare account and its token, which is what puts finished sites on the internet. Eight minutes to paste the AI brain's key and fill in one settings tab. Two of these are already on the operator's personal to-do list from the first plan - the Cloudflare account and the email credentials - and they simply live inside these forty-five minutes now.

Task	Who does it	Status or time
Site template, builder scripts, five workflows	Assistant	Done - delivered in the kit
Example site, Mac installer, Windows installer	Assistant	Done - delivered in the kit
Setup walkthrough, troubleshooting guide, dashboard	Assistant	Done - delivered in the kit
Spreadsheet plus four free accounts	Operator, click-by-click	About 35 minutes, once
Pasting keys and tokens into one settings file	Operator	About 10 minutes, once
Answering calls, updating statuses, collecting money	Operator	Ongoing; this is the actual job

Table 4: Division of labor, updated to today

After those forty-five minutes, the machine runs the build, the hunt, the outreach, the invoices, and the upsell on its own schedule. What remains permanently human is exactly what the operator said they wanted to keep: greeting, listening, closing, and confirming the money landed.

6. The 45-Day Clock

Because the building phase is over, the clock no longer starts at "someday." It starts at ignition: the day the forty-five minutes of account-connecting are done and the first automated hunt runs. From that moment, the path to $2,350 is a schedule, not a hope.

Days	What happens	Collected
Days 1-7	Ignition done; the machine hunts and builds on its own; roughly seventy outreach messages go out	$0
Days 8-14	First yes expected; one finished site delivered and paid for at the friend price	$500
Days 15-28	Follow-ups mature; volume passes a hundred touches; second yes lands; the machine offers the helper to the happy client	$650 + $400
Days 29-45	Third yes, with live examples and a testimonial behind the pitch	$800
Day 45	Total collected	$2,350

Table 5: The forty-five days, week by week

The ladder has slack built in. If the first yes slips a week - and it might - the math still lands inside the window, because the outreach volume compounds on its own and does not depend on the operator finding spare hours. The machine keeps ten messages a day flowing whether week two goes well or goes quiet, which is precisely the point of having built it.

One honest note belongs here: the week-by-week table is a plan, not a promise. The part that is a promise is the machinery: the touches go out, the follow-ups fire, the invoices generate, and the upsell gets offered, every single day, without anyone remembering to press anything. Selling stays a probability game; the factory's job is to keep the dice rolling without rest.

7. A Day in the Life, Launch Edition

Morning: the operator

The day starts with the phone, and the phone already knows everything. The morning report lists today's ten touches, every due follow-up, and anything that needs attention - it arrived at 9:00 while the coffee was brewing. The outreach itself already went out at 9:11, written personally per plumber and sent without a single click. Mid-morning brings a call with a plumber who just watched a short phone video scrolling through a website bearing his own name; the conversation is short because the thing already exists, and the only live questions are "do you want it" and "how do you want to pay."

Midday: one delivery and one update

A sale closed yesterday gets handed over today: the site's contact form rerouted to the client's own inbox, done with one command. The outcome gets marked from the phone in a five-second message to the Telegram bot - "status 17, won" - and the machine takes it from there: the invoice generates on its own, and two days later the $400 missed-call helper will be offered to that same client without anyone remembering to bring it up. The afternoon holds one testimonial request and tomorrow's list, which the machine is already assembling.

Evening: the client and the homeowner

A plumber who bought in last week gets a ping: a homeowner submitted the quote form three minutes ago, while he was under a sink. A call he misses that evening gets an instant text back, and the caller books for tomorrow. The homeowner with the burst pipe never thinks about any of this; she meets a clean page that loads instantly, a name that matches the truck outside, and a button her thumb can find without reading. Three people, one machine, and everybody comes out ahead before dinner.

8. Windows Now, MacBook Later

The first plan assumed the factory would wait for a new MacBook. The reality is better: the Windows laptop on the desk today runs the entire machine, unchanged, because Windows carries a full Linux layer inside it and the factory lives in that layer. Double-clicking one installer file, and approving one administrator prompt, turns the whole thing on. If Windows asks to restart once to switch that layer on, that is a once-ever event, and no Linux password is ever typed - the installer quietly makes its own hidden working user.

It also heals itself. Two invisible maintenance tasks were created alongside the install: one checks every five minutes that the factory's parts are alive and restarts anything that crashed, and it survives reboots, waking the machine within five minutes of login; the other runs the daily 7:40 lead hunt as a belt-and-suspenders backup. Closing the laptop overnight is fine - the heartbeat catches everything up when it opens again. A double-click dashboard file answers "what is up, what is down, and what to paste where" any time something looks wrong.

The Mac instructions say	On the Windows laptop instead
Copy the AI brain's key from the menu-bar app	Copy the key from a page that opens in the browser
Edit the settings file in TextEdit	Open the same file in Notepad through the Linux folder path
A larger offline backup brain	A smaller backup brain, sized for a laptop

Table 6: The only three practical differences

When the MacBook arrives, the move takes about fifteen minutes: copy the folder over, run the Mac installer, and paste the same secrets into the same settings file. Nothing actually migrates, because the spreadsheet, the Telegram bot, the Cloudflare account, and the Gmail all live in the cloud and never cared which laptop was asking. Until then, the phone remains the remote control for all of it - the commands work identically no matter which machine is humming at home.

9. Risks: The Honest Ones That Remain

The first plan carried a big honest risk: this machine had never been built, and free tools sometimes disappoint. That risk is retired - the factory exists, it was tested end to end, and it costs nothing to run. What remains are the ordinary risks of selling things to strangers, and each one comes with a patch already attached.

- The first yes may be slow. If no plumber has said yes by around day fourteen, the machine's own records show which messages got opened and which got ignored, so the wording or the friend price can be adjusted with evidence instead of guesswork. The $500 entry price exists precisely to make the first yes easy.
- Rejection volume is the tax, not the failure. Most people will say no or say nothing, and the plan is priced for that: a hundred touches containing three yeses is the machine working exactly as designed. Quiet weeks in the middle are expected; the calendar, not the mood, is the antidote.
- Machine-written words can occasionally be off-key. Every site the builder is unsure about gets flagged for a human read, and a pre-written default sits underneath as a quality floor, so the worst case is a plain site, never a broken one.
- Free tools can change their terms. The factory uses interchangeable parts behind one standard connection, so a swapped provider is an evening of adjustment, not a rebuild, and every account stays in the operator's own name.
- The laptop is the factory floor. The self-healing keeps it running, a weekly backup habit means a stolen machine costs a day plus the fifteen-minute migration, and the phone keeps commanding everything in between.
- Enthusiasm fades on hard weeks. The machine removes the excuse: the minimum viable day is answering what already rang, because the ten touches went out whether or not anyone felt inspired.

The one failure with no patch is the same one the first plan named: sending nothing. Every other item on this list has a response bolted to it. The factory's deepest purpose is to make silence impossible on the outreach side, so that the only human job left is the one humans are actually good at - picking up the phone when it rings.

10. After the First $2,350

The forty-five-day clock ends with money in the account and three live storefronts on the internet carrying the Charm City Sites signature. The second act is repetition with variation: point the same factory at electricians, then heating-and-cooling shops, then roofers, one trade at a time. Nothing gets rebuilt; the machine simply gets new rows, and every lesson the spreadsheet records about which words, prices, and neighborhoods convert makes the next yes cheaper to earn than the last.

Two quiet upgrades follow naturally, exactly as the first plan sketched them. A small monthly care plan, offered only to clients who ask, covers tiny edits and keeps phone numbers current, and even a handful of those turns lumpy income steadier. The missed-call helper grows into a fuller after-hours assistant that answers common questions and books jobs while the owner sleeps, which tradespeople pay for gladly because it works the hours they cannot.

And the moat compounds on its own. The machine stays private, the lead sheet grows into a private record of what actually works in this city, the testimonials stack up faster than any copycat can fake them, and the name keeps being the same name. Growth, if it comes, arrives because demand pulls it, not because the operator pushes.

11. Where This Came From

Document	Charm City Sites: Business Plan, Launch Edition
Date written	September 28, 2026
Source	zai-web conversation (bookmark it in the browser to reopen it without searching)
Session ID	web-e15a3a9a-9a75-4e64-b32c-a8d954bad4bf
Chat ID	478466ed-b8b6-467c-9097-f991c4dba44c
The factory kit	download/charm-city-sites/ - start with README.md, then OPERATIONS.md; WINDOWS.md covers the laptop track
Example site	Bayview Plumbing Co - a finished demo built by the real generator, in the kit's demo-site folder
Login email	_____ (write it in; only visible on the account holder's side)

This plan was drafted with the same AI assistant, in the same working conversation that researched the tools, wrote the first plan, and then built the factory this plan describes. The identifiers below exist so that conversation can be found again without digging through twenty accounts; bookmarking it in the browser is the fastest route back, and this document is the durable record either way. It is meant to be shared freely with anyone the operator chooses to trust with it.
